

1. What did you find was the most difficult part of the project?

I found translating what needed to be done into actual code the most difficult part.

2. If you could redo the project would you do anything differently?

I am not sure that I would do anything differently.

3. Say we wanted you to make the system only use a single button. When the button is held, the light on the other board is on and when it is released it is off. How would you do that?

I would use a function that checks whether or not the status of the button is on and to send the on command if it is, and to send the off command if it is not, and I would be calling the function constantly in main.
